

## Lecture 4 Discrete valuation rings

We say that a commutative ring  $R$  is a *local ring* if  $R$  has a unique maximal ideal

$\mathfrak{m} \subseteq R$ . If a local ring  $R$  is s.t.

(i)  $R$  is a PID (so in particular  $R$  is integrally closed)

(ii)  $|\text{Spec}(R)| = 2$  (so that  $R$  is not a field)

then we say that  $R$  is a *discrete valuation ring* and call any element  $t \in \mathfrak{m}$

that generates  $\mathfrak{m} = \langle t \rangle_R$  a *local parameter*. Note that for each nonzero

$x$  in the field of fractions  $F$  of  $R$  we have a unique element  $\text{ord}(x) \in \mathbb{Z}$  s.t.

$$x = u t^{\text{ord}(x)}, \text{ where } u \in R^\times.$$

Prop'n 2.3 Let  $(R, \mathfrak{m}, k)$  be a Noetherian local domain s.t.  $\dim(R) = 1$ . The following are equivalent

(i)  $R$  is a DVR

(ii)  $R$  is integrally closed

(iii) The maximal ideal  $\mathfrak{m}$  is principal

(iv) The Zariski cotangent space  $\mathfrak{m}/\mathfrak{m}^2$  has dimension one (over  $k$ ).

(v) For each nonzero ideal  $\mathfrak{a} \subseteq R$  there is  $n \in \mathbb{Z}$  s.t.  $\mathfrak{a} = \mathfrak{m}^n$ .

(vi) There is  $t \in R$  s.t. for each nonzero ideal  $\mathfrak{a} \subseteq R$  s.t.  $\mathfrak{a} = t^n R$

Proof

(i)  $\Rightarrow$  (ii): We shall use the following.

Lemma 2.2 Suppose  $B$  is a valuation ring of a field  $K$ , that is,  $B$  is an integral domain with field of fractions  $K$  s.t. for each  $x \in F^\times$  either  $x \in B$  or  $x^{-1} \in B$ . Then  $B$  is integrally closed.

Proof of Lemma

Let  $x \in K$  be integral over  $B$ , so  $\exists b_0, \dots, b_{n-1} \in B$  s.t.

$$x^n + b_{n-1}x^{n-1} + \dots + b_0 = 0$$

\*

Case 1.  $x \in B$ : Then we are done.

Case 2.  $x \in B$ : Then  $x^{-1} \in B$ , so if we divide (\*) by  $x^{1-n}$  we have

$$x + b_{n-1}x^{-1} + \dots + b_0x^{1-n} = 0$$

thus

$$x = -(b_{n-1}x^{-1} + \dots + b_0x^{1-n}) \in B$$

and the lemma follows.

As a DVR is a valuation ring, (ii) follows.

(ii)  $\Rightarrow$  (iii): We shall use the following.

Lemma 2.3 If  $\mathcal{I} \subseteq R$  is a nonzero ideal of a 1-dimensional local domain  $(R, \mathfrak{m})$  then there is  $n \in \mathbb{Z}_{>1}$  s.t.

$$\mathfrak{m}^n \subseteq \mathcal{I} \text{ \& \ } \mathfrak{m}^{n-1} \not\subseteq \mathcal{I}.$$

*Proof of lemma*

Each  $\mathcal{I}$  as above is  $\mathfrak{m}$ -primary. Indeed, (\*) implies that  $\mathfrak{p} = \mathfrak{m}$  is the only prime ideal such that  $\mathcal{I} \subseteq \mathfrak{p}$ , hence

$$\text{rad}(\mathcal{I}) = \bigcap_{\mathfrak{p} \in \text{Spec}(R) \text{ s.t. } \mathcal{I} \subseteq \mathfrak{p}} \mathfrak{p} = \mathfrak{m}.$$

So by Prop'n 2.2  $\exists n \in \mathbb{Z}_{>1}$  s.t.  $\mathfrak{m}^n \subseteq \mathcal{I}$  &  $\mathfrak{m}^{n-1} \not\subseteq \mathcal{I}$ . The lemma follows.

Pick a nonzero  $a \in \mathfrak{m}$ . By Lemma 2.3  $\exists n \in \mathbb{Z}_{>1}$  s.t.  $\mathfrak{m}^n \subseteq Ra$  &  $\mathfrak{m}^{n-1} \not\subseteq Ra$ .

So there is  $b \in \mathfrak{m}^{n-1} \setminus Ra$ . Let  $F$  be the field of fractions of  $R$  and put

$$x := \frac{a}{b} \in F$$

As  $b \notin Ra$ , then  $x^{-1} \notin R$ . But  $R$  is integrally closed. Thus  $x^{-1}$  is not integral over  $R$ , so

$$x^{-1}\mathfrak{m} \not\subseteq \mathfrak{m} \quad (R \text{ is Noetherian}) \quad \star$$

Claim We have  $x^{-1}\mathfrak{m} \subseteq R$ , an ideal of  $R$ .

Proof of claim

Since  $b \in \mathfrak{m}^{n-1}$ , we have  $\forall \alpha \in \mathfrak{m} : b\alpha \in \mathfrak{m}^n \subseteq Ra$ . Thus  $x^{-1}\mathfrak{m} \subseteq R$ .

Clearly  $x^{-1}\mathfrak{m}$  is an ideal and the claim follows.

But  $(R, \mathfrak{m}, k)$  is a local ring, so  $R \setminus \mathfrak{m} = R^\times$  and  $(\star)$  implies that

$$\alpha^{-1} \mathfrak{m} = R.$$

Thus

$$\mathfrak{m} = \alpha R$$

and (iii) follows.

*Variant of Nakayama's Lemma*

(iii)  $\Rightarrow$  (iv): Given a finitely generated module  $M$  over a local ring  $(R, \mathfrak{m}, k)$  and  $\alpha_1, \dots, \alpha_n \in M$  s.t.  $\{\bar{\alpha}_1, \dots, \bar{\alpha}_n\} \subseteq M/\mathfrak{m}M$  is a  $k$ -basis, we

have  $M = \langle \alpha_1, \dots, \alpha_n \rangle_R$ . In particular, for  $M = \mathfrak{m}$  we have  $\dim_k(\mathfrak{m}/\mathfrak{m}^2) \leq 1$

as  $\mathfrak{m} = \langle \alpha_1 \rangle_R$  by (iii). To obtain equality we'll use the following.

Lemma 2.4 If  $(R, \mathfrak{m})$  is a Noetherian local ring, then exactly one of the following holds true:

(a)  $\mathfrak{m} \neq \mathfrak{m}^2 \neq \mathfrak{m}^3 \neq \dots$

(b)  $\exists n \in \mathbb{Z}_{\geq 1}$  s.t.  $\mathfrak{m}^n = 0$ . In which case  $R$  is Artinian.

Proof of lemma

Suppose  $\neg$  (a), so  $\exists n \in \mathbb{Z}_{\geq 1}$  s.t.  $\mathfrak{m}^n = \mathfrak{m}^{n+1}$ . Recall that Nakayama's lemma

says that for every f.g.  $R$ -module  $M$  and  $\mathfrak{a} \subseteq J(R)$ :  $\mathfrak{a}M = M \Rightarrow M = 0$ .

Here  $J(R)$  is Jacobson's radical. So if  $M = \mathfrak{m}^n$  &  $\mathfrak{a} = \mathfrak{m}$ , then  $\mathfrak{m}^n = 0$ .

So for each  $\mathfrak{p} \in \text{Spec}(R)$  we have

$$\mathfrak{m}^2 \subseteq \mathfrak{p}$$

Taking radicals we get  $\mathfrak{m} \subseteq \mathfrak{p}$ , thus  $\mathfrak{m} = \mathfrak{p}$  i.e. (b) and the lemma follows.

As  $\dim(R) = 1$ , the ring  $R$  is not Artinian. So by Lemma 2.4  $\mathfrak{m}/\mathfrak{m}^2 \neq 0$ . But we have shown that

$$\dim_k(\mathfrak{m}/\mathfrak{m}^2) \leq 1.$$

Therefore this inequality is in fact an equality and (iv) follows.

(iv)  $\Rightarrow$  (v): As  $\dim_k(\mathfrak{m}/\mathfrak{m}^2) = 1$ , there is  $t \in \mathfrak{m} \setminus \mathfrak{m}^2$ . In particular,  $t \neq 0$ , and Lemma 2.4 implies that we have a chain of ideals

$$\dots \subsetneq \mathfrak{m}^3 \subsetneq \mathfrak{m}^2 \subsetneq \mathfrak{m}$$

Indeed, (b) implies that  $t^n = 0$ , contradicting  $R$  is an integral domain, so (a) follows.

Claim For each  $i \in \mathbb{Z}_{>1}$  we have  $\dim_k(\mathfrak{m}^i / \mathfrak{m}^{i+1}) = 1$ .

Proof of claim

As  $\mathfrak{m} / \mathfrak{m}^2 = \langle \bar{t} \rangle_k$  then the variant of Nakama's lemma implies  $\mathfrak{m} = \langle t \rangle_R$  and

$$k = R/\mathfrak{m} \cong \mathfrak{m}^i / \mathfrak{m}^{i+1}$$

$$\bar{x} \longmapsto t^i \bar{x}$$

Indeed, as  $\mathfrak{m}^n = t^n R = \langle t^n \rangle_R$  then  $\mathfrak{m}^n / (\mathfrak{m} \mathfrak{m}^n) = \langle \bar{t}^n \rangle_k$ . So the claim follows.

By Lemma 2.3, for each nonzero ideal  $\mathcal{I} \subseteq R$  there is  $n \in \mathbb{Z}_{\geq 1}$  s.t.

$$\mathcal{I} \subseteq \mathfrak{m}^n \text{ \& } \mathcal{I} \not\subseteq \mathfrak{m}^{n+1}.$$

So there is  $a \in \mathcal{I} \setminus \mathfrak{m}^{n+1}$  and the above claim implies that

$$\mathfrak{m}^n / \mathfrak{m}^{n+1} = \langle \bar{a} \rangle_k$$

Therefore the variant of Nakayama's Lemma yields

$$\mathfrak{m}^n = \langle a \rangle_R = Ra \subseteq \mathcal{I}$$

Thus  $\mathcal{I} = \mathfrak{m}^n$  and (v) follows.

(v)  $\Rightarrow$  (vi): As  $R$  is not Artinian, Lemma 2.4 implies that  $\mathfrak{m} \neq \mathfrak{m}^2$ , so

there is  $t \in \mathfrak{m} \setminus \mathfrak{m}^2$ . But  $Rt = \mathfrak{m}^n$ , for some  $n \in \mathbb{Z}_{>1}$ , thus  $n = 1$  and  $Rt = \mathfrak{m}$ , so  $Rt^n = \mathfrak{m}^n$ . The claim follows.

(vi)  $\Rightarrow$  (i): We have  $Rt = \mathfrak{m}$ , so for each  $k \in \mathbb{Z}_{>1}$ ,

$$Rt^k \neq Rt^{k+1}$$

So  $\forall$  nonzero  $a \in R \exists!$   $k_0$  s.t.  $Ra = Rt^{k_0}$ ; define  $v(a) := k_0$ .  $\square$

Corollary If  $R$  is a Dedekind domain, then for each nonzero ideal  $\mathfrak{a} \subseteq R$  there exist unique  $\{p_1, \dots, p_g\} \subseteq \text{Spec}(R)$  s.t.

$$\mathfrak{a} = p_1^{e_1} \cdots p_g^{e_g}.$$
